A comment here says that this book is too complicated and not well written. My young son agrees and prefers going on reading his comics. As far i'm concerned this is the best Logistics (in the broad sense) book i've ever read. It is perfectly structured and it is written in a particular clear way with lot of figures and tables. At the end of the chapters there are some useful exercises with solutions. The book is particularly useful for IT professionals.

This book is too complicated and not well-written. Reading this book feels like reading a science or an engineering book more than a management book. It's focusing on mathematical formulas in a very high level of detail, which the reader finds useless. I found myself skipping a lot of pages; the pages I skipped are definitely more than ones I read. The only reason I bought this book is because it's a CPIM required source. You are probably checking this book out for the same reason. I hope by the time you read my review, CPIM will decide to eliminate this book from its list of required sources.

Successful companies must strive to improve business processes on a comprehensive, coordinated level. *Integral Logistics Management: Planning and Control of Comprehensive Supply Chains, Second Edition* examines logistics in areas beyond the flow of goods, investigating administrative and planning logistics, or process control. What's New in the Second Edition:  
A review of E-business developments  
Additional concepts in transcorporate supply chain management  
Expanded treatment of master planning  
Sections on distribution planning and control  
More details on safety stock calculation and service level vs. fill rate  
Revised chapter on the process industry  
Comprehensive extension and update of terminology per CPIM exam content manual, covering all five CPIM modules  
More examples from real industrial practice  
Keywords at the end of each chapter, as well as scenarios and exercises, many of which include interactive, online elements  
This volume presents the characteristics, tasks, methods, and techniques of planning and control, detailing innovations in supply chain management, Just-in-Time, Enterprise and Manufacturing Resource Planning (ERP and MRP II), one-of-a-kind production, manufacturing in the process industry, and more. It provides students, industrial engineers, business managers, computer scientists, and other professionals with critical information for improving processes within both manufacturing and service industries.
